Evaluation of in-vitro antioxidant and cytotoxic activity of methanolic leaf extract of Blumea lanceolaria ROXB

Kalyani Saikia, R Lalawmpuii and Pratap Kalita

Abstract
The present study describes antioxidant activities and cytotoxic activity of methanolic leaf extract of Blumea lanceolaria (Asteraceae). The antioxidant activities were determined by in-vitro screening models; DPPH radical scavenging activity, Nitric oxide scavenging activity along with the estimation of total phenolic and flavonoid content. From the result of DPPH radical scavenging activity and Nitric oxide scavenging activity the extract shows antioxidant activity with the IC₅₀ values 55.56µg/ml and 70.60µg/ml respectively. The total phenolic and flavonoid content were found to be 60.20 gallic acid equivalent/gm of dried extract and 60 quercetin equivalent/gm of dried extract. The cytotoxic activity was investigated by MTT assay on HeLa (Human cervical cancer) cell line. The MTT assay suggest that the leaf extract of Blumea lanceolaria exhibited moderate cytotoxicity (20<IC₅₀<100) against HeLa cell lines with IC₅₀ 95.63µg/ml.

Keywords: Blumea lanceolaria, antioxidant activity, total phenolics and flavonoid, MTT assay

Introduction
Natural products are important source of new drugs, new drug leads and new chemical entities and are being used for the treatment of several ailments in North-East India. The main characteristic of an antioxidant is its ability to trap free radicals. Antioxidants act by interfering with the oxidation process by reacting with free radicals. Plant molecules, their semi-synthetic and synthetic derivatives are important sources of antitumor drugs. Herbal antioxidants have been successfully employed as rejuvenators, for several centuries in the Indian systems of alternative medicine [1]. Flavonoids and phenolic acids are particularly effective as they are known to exhibit anticarcinogenic, antiviral, antiinflammatory and antiallergic properties. Blumea lanceolaria (Roxb.) Druce belonging to the family Asteraceae commonly has known as Baurze, Terapaibi, Ghanashyam haak is a perennial herb available in different states of India. Blumea lanceolaria is a unique traditional medicine used in Mizoram and Africa as well. A decoction of the leaves is taken orally to treat stomach ulcers, dysentery and wounds [2]. The Chakma peoples traditionally used the paste of leaves for the treatment of fever by applying on head and forehead. In addition the leaves are edible and also used as flavouring agent. In Assam people use the juice of the leaves of Blumea lanceolaria in the treatment of cough.

Materials and methods
The leaves of Blumea lanceolaria were collected from Thenzawl area, Aizawl, Mizoram during October 2016. The plant is identified by Botanical Survey of India, Eastern Regional Centre, Shillong-793003; the voucher specimen is (BSI/ERC/2010) RP/080.

Preparation of extract: The collected fresh leaves of the plant were cleaned, washed and dried under shade for three weeks. The air dried leaves were crushed and the powdered leaves (400gm) were extracted at room temperature successively by Soxhlet apparatus using petroleum ether followed by chloroform and methanol as solvent respectively for 50 hours. The solvents were recovered by distillation under reduced pressure using rotary vacuum evaporator to obtain crude petroleum ether extract (15gm), chloroform extract (13gm) and methanol extract (12gm). The extracts were kept in air tight container and the methanol extract was used for evaluation of different biological activities.
Antioxidant activity: In this study the in-vitro antioxidant activity of methanolic leaf extract of *Blumea lanceolaria* was evaluated by DPPH radical scavenging method and nitric oxide scavenging method and was compared with standard.

DPPH radical scavenging activity: DPPH radical scavenging activity was evaluated according to the method described by Blois (1958) with minor changes [3]. Butylated hydroxy anisole (BHA) was used as reference standard. 0.5 ml of DPPH solution in methanol (0.1 mM) was mixed with 3 ml of the extract and 3 ml of standard prepared in various concentrations (10, 20, 40, 60, 80, 100 μg/ml), respectively. The extract and standards were incubated for 30 minutes at 37°C. Absorbance was measured at 517 nm using ultraviolet-visible (UV-Vis) spectrophotometer. Control reading was also taken and IC\(_{50}\) value was determined [4]. The scavenging effect of DPPH free radical was calculated using the following equation,

\[
\% \text{ inhibition} = \frac{\text{absorbance of control} - \text{absorncanc of test}}{\text{absorbance of control}} \times 100
\]

Assay of nitric oxide scavenging activity: Nitric oxide scavenging activity can be estimated by the use of Griess III Osvoy reaction [5]. For the experiment, sodium nitroprusside (10mM) in phosphate buffered saline was mixed with different concentrations (10, 20, 40, 60, 80, 100 μg/ml) of methanol extract were dissolved in methanol and incubated at 30°C for 2 hours. The same reaction mixture without the extract but the equivalent amount of methanol served as the control. After the incubation period, 0.5 ml of Griess reagent (1% sulfanilamide, 2% H\(_3\)PO\(_4\) and 0.1% N-(1-naphthyl) ethylene diamine dihydrochloride) was added. The absorbance of the reaction mixture was immediately read at 550 nm. Inhibition of nitrite formation by the plant extract and standards were incubated for 30 minutes at 37°C. Absorbance was measured to determine total plant (50μg/ml) was also mixed with the above reagents and after 1 hr, absorbance reading was taken at 510 nm. A standard curve was prepared with Quercetin at different concentrations (10, 20, 40, 60, 80, and 100 μg/ml). From the calibration curve of the reference standard, the total flavonoid content was determined and expressed as milligrams of Quercetin equivalent (QE/g) of extract [4], table 2.

Evaluation of MTT assay (MTT Assay for anticancer activity): Cell lines and Culture medium: A HeLa (Human cervical cancer) cell line was procured from National Centre for Cell Sciences (NCCS), Pune, India. The stock cells were cultured in DMEM supplemented with 10% inactivated Fetal Bovine Serum (FBS), penicillin (100 IU/ml), streptomycin (100μg/ml) and amphotericin B (5μg/ml) in a humidified atmosphere of 5% CO\(_2\) at 37°C until confluent. The cells were dissociated with trypsin solution (0.2% trypsin, 0.02% ethylenediaminetetra acetic acid, 0.05% glucose in PBS). The stock cultures were grown in 25 cm\(^2\) culture flasks, and all experiments were carried out in 96 micro titre plates [8].

Procedure: The cytotoxic activity of the methanol leaf extracts of *Blumea lanceolaria* was investigated using the MTT assay (Sigma, USA) on human cervical cancer cell line (HeLa). The cells were seeded in 96-well plates at a density of 1 X 10\(^4\) cells per well. After incubation for 20–24 h, the cells with 70–80% confluency were treated with the extracts at different concentrations (10, 20, 60, 80, 100 μg/ml) and incubated for 72 h. Then, 20 μL of MTT (5mg/ml) solution was added to cells per well, and the plate was moved to a cell incubator for another 4 h. The medium was removed, and 150 ml of DMSO (dimethyl sulfoxide) was added to the cells. The plate was gently shaken for 15 min to dissolve the formazan crystals generated by proliferating cells, and the measurement was performed using a Spectamax M2 Microplate Reader (Molecular Diagnostic, Inc.) at a wavelength of 550 nm. Relative viability was calculated taking wells with non treated cells as 100% control. The results are expressed as mean values (±SD) of six repeats. The IC\(_{50}\) values were obtained by nonlinear regression using the GRAPHPAD program [10]. In this screening program, we adopted the criteria of the American National Cancer Institute (NCI) to consider a crude extract promising for further purification based on the IC\(_{50}\) values as active, moderately active or inactive, when the IC\(_{50}\) values are lower than 20 μg/ml, from 20 to 100 μg/ml, or higher than 100 μg/ml, respectively in order to discover and develop potential anticancer natural compounds [11].

Results and discussion

Determination of total phenolic content: The total phenolic content was determined using the method of Mc Donald et al. with modifications [9]. Calibration curve was prepared by mixing 1 ml of methanolic solution of Gallic acid (10, 20, 40, 60, 80, and 100 μg/ml) with 5 ml Folin–Ciocalteu reagent (diluted tenfold). After 3 minutes, 4 ml of sodium carbonate solution (0.7 M) was added, and the mixture was allowed to stand for 1 hr at room temperature. Absorbance was measured at 765 nm using UV-Vis spectrophotometer. 1 ml extract (50μg/ml) was also mixed with the above reagents and after 1 hr the absorbance was measured to determine total plant phenolic content. From the calibration curve, the amount of phenolic compounds was determined and expressed as milligrams of Gallic acid equivalent (GAE)/g of the extract [4], table 2.

Determination of total flavonoid content: The total flavonoid content was determined by the aluminium chloride method. 1 ml of the extract (50μg/ml) was mixed with 2 ml of distilled water. After 5 minutes, 3 ml of 5% sodium nitrite (NaNO\(_2\)) and 0.3 ml of 10% aluminium chloride (AlCl\(_3\)) were added. After 6 minutes, 2 ml of NaOH (1 M) was added, and the volume was made up to 10 ml with distilled water. After 1 hr, absorbance reading was taken at 517 nm. A standard curve was prepared with Quercetin at different concentrations (10, 20, 40, 60, 80, and 100 μg/ml). From the calibration curve of the reference standard, the total flavonoid content was determined and expressed as milligrams of Quercetin equivalent (QE/g) of extract [4], table 2.
Assay of nitric oxide scavenging activity: Nitric oxide (NO) is an important chemical mediator generated by endothelial cells, macrophages, neurons, etc. and is involved in the regulation of various physiological processes. Excess concentration of NO is associated with several diseases. NO scavenging capacity is determined by the decrease in the absorbance at 550 nm, induced by antioxidants [6]. The results of NO scavenging activity of the extracts and BHA are shown as percent of NO scavenging in table 1. The IC50 values were found to be 70.60µg/ml and 26.58µg/ml respectively.

Determination of total phenolic content: Phenolics and flavonoids have been reported to be the main phytochemical responsible for antioxidant capacity of fruits and vegetables. Plant-derived polyphenols display characteristics inhibitory pattern towards oxidative reaction in vitro and in vivo. In this study, a total phenolics concentration equivalent of Gallic acid was estimated according to Folin– Ciocalteu method. [4]. The total phenolic content of the extract was expressed as Gallic acid equivalent /gm and was found to be 67.20 mg GAE/g.

Determination of total flavonoids content: Flavonoids are a group of polyphenolic compounds, which exhibit several biological effects such as anti-inflammatory, anti-hepatotoxic, anti-ulcer, anti-allergic, anti-viral and anti-cancer activities [13]. They are capable of effectively scavenging the reactive O2 species because of their phenolic hydroxyl groups and so they are potent antioxidants also. The total flavonoid content of methanol leaf extracts of Blumea lanceolaria was found to be 60 mg/gm of extract in terms of Quercetin equivalent.

Evaluation of MTT assay: In order to assess the cytotoxic effect of Blumea lanceolaria methanol extract on HeLa (Human cervical cancer) cell lines, MTT assay was performed. In the present study, cytotoxicity of plants extract showed increase in cell death with the increase in concentration of plant extracts on HeLa cell lines. The cytotoxicity of plants extract showed increase in cell death with the increase in concentration of plant extracts. As a positive control Doxorubicin was used which showed active cytotoxic activity against HeLa cell lines. The % cell viability of the extract was reduced as the concentration is increased and IC50 value was found to be 95.63. Thus, according to NCI [11], from the result in MTT assay suggest that the leaf extract of Blumea lanceolaria exhibited moderate cytotoxicity (20<IC50>100) against HeLa cell lines.

**Conclusion**

Searching plant sources may bring new natural products into pharmaceutical, cosmetic and food production. On the basis of the results obtained in the present study, the methanol leaf extract of Blumea lanceolaria possess significant antioxidant and cytotoxic activity. Presence of phenol and flavonoid compounds may account for this fact. So it can be concluded that the leaves of Blumea lanceolaria is a good natural medicine.
